CHAPTER 3 NUMERICAL CALCULATIONS

Light & fan calculation(Theory)

Formula for Light Bulbs,

$$E = (n \cdot N \cdot F \cdot LLF \cdot UF) / A \quad (\text{Lumen in m}^2)$$

E = Illuminance

N = Number of lights

n = Number of lights per illuminate = 1 (by default)

F = lumen of the light bulb = 1250 lumen (20 watt)

LLF = Light loss factor UF = Utilization factor

LLF * UF = 0.72 (0.7 ~0.75)

Formula for Fans,

One 56'' diameter fan is needed every 100 sq ft

Number of Fans = A / 100 (A in sqft) (1 sqft = 0.09290304 m²)

Light & fan calculation Ground floor

Kitchen/ Store room:

Area, A = 14 * 15 sq ft = 210 sq ft = 19.509638 m² E = 80 lumen/ m²

LLF x UF = 0.72

n = 1

Flux = 1250 lumen

From calculation,

Number of lights, N = 1.73419

So, 2 Light Bulbs are needed.

But, to preserve power consumption, 1 LB is set in the store room and 1 TA is set in the kitchen.

Also 1 exhaust fan is set in the kitchen.

Guard/ Driver room:

Area, A = 16 * 20 sq ft = 320 sq ft = 29.7289728 m²

E = 80 lumen/ m²

LLF x UF = 0.72

n = 1

Flux = 1250 lumen

From calculation,

Number of lights, N = 2.64267

So, 2 Light Bulbs and 1 Tube Light are needed.

But, to preserve power consumption, 1 light bulb(LB) and 1 tube light(TA) are set.

Number of fans = 320/ 100 = 3.2

So, 3 fans are needed, but to preserve power consumption, 1 ceiling fan(FA) is set.

Bathroom:

Area, $A = 14 * 5 \text{ sq ft} = 70 \text{ sq ft} = 6.5032128 \text{ m}^2$

$E = 80 \text{ lumen/ m}^2$

$LLF \times UF = 0.72$

$n = 1$

Flux = 1250 lumen

From calculation,

Number of lights, $N = 0.578$

So, 1 Light Bulb(LB) is needed.

Parking :

$A = (14+16+14+14+16+14)*(20+6+20-20) = 88*26 \text{ sq ft} = 2288 \text{ sqft} = 212.562155 \text{ m}^2$

$E = 80 \text{ lumen/ m}^2$

$LLF \times UF = 0.72$

$n = 1$

Flux = 1250 lumen

From calculation,

Number of lights, $N = 18.89$

So, 19 LS are needed.

Satire case:

1 TS and 1 LS are set in the satire case.

Light & fan calculation (1st and 2nd floor)

Bedroom 1 and Drawing room:

Area = $16 * 20 \text{ sq ft} = 320 \text{ sq ft} = 29.7289728 \text{ m}^2$

$E = 100 \text{ lumen/ m}^2$

$LLF \times UF = .72$

$n = 1$

Flux = 1250 lumen

From calculation,
Number of lights, $N = 3.3032192$
So, we used 2 TA and 1 LB
Number of fans = $320 / 100 = 3.2$
To preserve power consumption we have used 2 fans(FA).

Bedroom 2 & Bedroom 3:

Area = $14 * 20$ sq ft = 280 sq ft = 26.0128512 m²
E = 100 lumen/ m²
LLF x UF = .72
n = 1
Flux = 1250 lumen
From calculation,
Number of lights, $N = 2.89$
So, we used 2 TA and 1 LB
Number of fans = $280 / 100 = 2.8$
2 fans(FB) are set

Dining room:

Area = $14 * 18$ sq ft = 252 sq ft = 23.411566 m²
E = 100 lumen/ m²
LLF x UF = .72
n = 1
Flux = 1250 lumen
From calculation,
Number of lights, $N = 2.60128$
So, we used 2 TA and 1 LB
Number of fans = $252 / 100 = 2.52$
1fan(FA) is set to preserve power consumption.

Corridor:

Area = $6 * 21$ sq ft = 126 sq ft = 11.705783 m²
E = 70 lumen/ m²
LLF x UF = .72
n = 1
Flux = 1250 lumen
From calculation,
Number of lights, $N = 0.9104497$
We used 1 LS.

Kitchen:

Area = $8 * 14$ sq ft = 112 sq ft = 10.40514 m²
E = 200 lumen/ m²

$$LLF \times UF = .72$$

$$n = 1$$

$$\text{Flux} = 1250 \text{ lumen}$$

From calculation,

$$\text{Number of lights, } N = 2.31225$$

We used 1 TA and 1 LB

$$\text{Number of fans} = 112 / 100 = 1.12$$

1 exhaust fan is needed.

Toilet 1:

$$\text{Area} = 6 \times 9 \text{ sq ft} = 54 \text{ sq ft} = 5.016764 \text{ m}^2$$

$$E = 100 \text{ lumen/ m}^2$$

$$LLF \times UF = .72$$

$$n = 1$$

$$\text{Flux} = 1250 \text{ lumen}$$

From calculation,

$$\text{Number of lights, } N = 0.55741824$$

We used 1 TB and 1 LB, where the extra one is kept for alternative uses.

Toilet 2:

$$\text{Area} = 8 \times 12 \text{ sq ft} = 96 \text{ sq ft} = 8.91869 \text{ m}^2$$

$$E = 100 \text{ lumen/ m}^2$$

$$LLF \times UF = .72$$

$$n = 1$$

$$\text{Flux} = 1250 \text{ lumen}$$

From calculation,

$$\text{Number of lights, } N = 0.990965$$

We used 1 TB and 1 LB, where the extra one is kept for alternative uses..

Veranda:

$$\text{Area} = 16 \times 4 \text{ sqft} = 64 \text{ sq ft} = 5.94579 \text{ m}^2$$

$$E = 70 \text{ lumen/ m}^2$$

$$LLF \times UF = .72$$

$$n = 1$$

$$\text{Flux} = 1250 \text{ lumen}$$

From calculation,

$$\text{Number of lights, } N = 0.46245$$

Here, though only 1 light is needed, we used 1 LS and 2 LB for decoration purposes.

Staircase: 2 TS and 2 LS are set in the staircase.

Switchboard Diagram Ground Floor:

CKT 1:

$$P = LB1 + SS1 + EX1 + SS2 + FA1 + LB3$$

$$I = (45 + 60 + 100 + 100 + 100 + 60) / (220 * 0.8) = 2.64 \text{ A}$$

$$(\text{voltage} = 220\text{V}, \text{PF} = 0.8) \quad (I = PV * PF)$$

CKT 2:

$$P = LB2 + LB4 + FA2 + SS3 + SS4$$

$$I = (60 + 60 + 100 + 100 + 100) / (220 * 0.8) = 2.38 \text{ A}$$

CKT 3:

$$P = LS20$$

$$I = 23 / (220 * 0.8) = 0.13 \text{ A}$$

CKT 4:

$$P = LS1 + LS2 + LS3 + LS6 + LS7 + LS8 + LS18$$

$$I = (7 * 23) / (220 * 0.8) = 0.91 \text{ A}$$

CKT 5:

$$I = (7 * 23) / (220 * 0.8) = 0.91 \text{ A}$$

All of the circuits above have current less than 5 A. So, 2 x 1.5rm BYM + 1.5 BYA ECC are used in all of them.

Switchboard Diagram 1st - 2nd floor

CKT 1: SB_1 + SB_6

$$P = TA1 + FB1 + SS1 + LB1 + TA5 + FA1 + LB6$$

$$I = (40 + 75 + 100 + 60 + 40 + 100 + 60) / (220 * 0.8) = 2.6988 \text{ A}$$

CKT 2: SB_4 + SB_5 + SB_8

$$P = LB4 + LB5 + LS1 + SS3 + LB7 + EX1 + S2 + LB9 + SS6$$

$$I = (60 + 60 + 23 + 100 + 60 + 45 + 100 + 60 + 100) / (220 * 0.8) = 3.4545 \text{ A}$$

CKT 3: SB_2 + SB_3

$$P = TB1 + FB2 + LS2 + S1 + FB4 + TA4 + LB3$$

$$I = (20 + 75 + 23 + 100 + 75 + 40 + 60) / (220 * 0.8) = 2.23295 \text{ A}$$

CKT 4: SB_10 + SB_7 + SB_9

$$P = D1 + FA4 + TA7 + LB8 + SS5 + TA10 + TA11 + SS7$$

$$I = (50 + 100 + 40 + 60 + 100 + 40 + 40 + 100) / (220 * 0.8) = 3.0113636 \text{ A}$$

All of the circuits above have current less than 5 A. So, 2 x 1.5rm BYM + 1.5 BYA ECC are used in all of them.

Calculation for SDB ground

SDB load = total load $\times 0.7$ + total P socket load $\times 0.2$ + total Q socket load $\times 0.2$

Total load = CKT1+ CKT2+ CKT3+ CKT4+ CKT5
 = (465+ 420+ 23+ 161+ 161) W
 = 1460 W

P load = 3000 W

Utility load = $5 \times 46 = 230$ W

SDB load = $(1460 \times 0.7 + 3000 \times 0.2)$ W = 1622 W

SDB current = $1622 / (220 \times 0.8) = 9.216$ A

So, 10 A SP MCCB is needed from SDB to MDB. 2×2.5 rm BYM + 2.5 BYAECC

Calculation for SDB 1st - 2nd floor

Total load = CKT1 + CKT2 + CKT3 + CKT 4 = 475+ 608 + 393 + 530
 = 2006

P Load = 3000 w

Q Load = 4000 w

5 P load and 3 Q load

Total load of SDB first floor

= $2006 \times 0.7 + 5 \times 3000 \times 0.2 + 3 \times 4000 \times 0.2 = 6804.2$ w

SDB current = $6804.2 / (220 \times 0.8) = 38.66$ A

So, 40A SP MCCB is needed from SDB to MDB.

2×16 rm BYM + 16 rm BYA ECC cable are needed.

Emergency Switchboard Diagram Ground Floor

CKT 1':

$I = (40 + 40) / (220 \times 0.8) = 0.45$ A

CKT 2':

$I = (40 + 60) / (220 \times 0.8) = 0.57$ A

CKT 3':

P = TS1

$I = 60 / (220 \times 0.8) = 0.341$ A

CKT 4':

P = LS5+ LS4+ LS9

$I = (3 \times 23) / (220 \times 0.8) = 0.392$ A

CKT 5':

P = LS13 + LS14

$I = (23 + 23) / (220 \times 0.8) = 0.26$ A

All of the circuits above have current less than 5 A. So, 2 x 1.5rm BYM + 1.5 BYA ECC are used in all of them.

Calculation for ESDB ground:

SDB load = total load $\times 0.7$ + total P socket load $\times 0.2$ + total Q socket load $\times 0.2$

$$\begin{aligned}\text{Total load} &= \text{CKT1}' + \text{CKT2}' + \text{CKT3}' + \text{CKT4}' + \text{CKT5}' \\ &= (80 + 100 + 60 + 69 + 46) \text{ W} \\ &= 355 \text{ W}\end{aligned}$$

$$\text{SDB load} = (355 \times 0.7) \text{ W} = 248.5 \text{ W}$$

$$\text{SDB current} = 248.5 / (220 \times 0.8) = 1.412 \text{ A}$$

So, 5 A SP MCCB is needed from ESDB ground to EMDB. 2 \times 1.5rm BYM + 1.5rm BYAECC

Emergency Switchboard Diagram 1st and 2nd Floor

CKT 1': SB_1 + SB_6

P = TA2+ FB2+ FA2+ TA6 + SS4

$$I = (40 + 75 + 100 + 40 + 100) / (220 \times 0.8) = 2.0170 \text{ A}$$

CKT 2': SB_5 + SB_8

P = TB2+ TA9

$$I = (20 + 40) / (220 \times 0.8) = 0.3409 \text{ A}$$

CKT 3' : SB_3

P = TA3+ SS2+ FB3

$$I = (40 + 100 + 75) / (220 \times 0.8) = 1.22159 \text{ A}$$

CKT 4': SB_10 + SB_7 + SB_9

P = TS1+ FA3+ TA8+ LB10 + FA5

$$I = (60 + 100 + 40 + 60 + 100) / (220 \times 0.8) = 2.04545 \text{ A}$$

All of the circuits above have current less than 5 A. So, 2 x 1.5rm BYM + 1.5 BYA ECC are used in all of them.

Calculation for ESDB 1st and 2nd floor

$$\text{Total load} = \text{CKT1} + \text{CKT2} + \text{CKT3} + \text{CKT 4} = 355 + 60 + 215 + 360 = 990 \text{ w}$$

$$\text{P Load} = 3000 \text{ w}$$

$$\text{Q Load} = 4000 \text{ w}$$

One P load and no Q load.

Total load at ESDB for first floor = $990 \times 0.7 + 3000 \times 0.2 = 1293 \text{ w}$

ESDB current = $1293 / (220 \times 0.8) = 7.35 \text{ A}$

10 A SP MCCB is needed from ESDB to EMDB.

2 x 2.5 rm BYM + 2.5 rm BYA ECC cable are needed.

Calculation for Conduits

Ampere rating, $I = PV \times pf \text{ A}$

Pf = 0.8 (avg)

Energy Saving bulb = 20 w

Tube Light = 60 w

Ceiling fan = 100 w

Switchboard Socket (max) = 1000 w

Ceiling light = 20 w

Exhaust fan = 45 w

All internal wires are below 5A rating. That's why, 2 x 1.5 rm BYM is used in all internal wiring.

Calculation for EMDB

EMDB load = Total ESDB load x 0.7

Total ESDB load = 4 x ESDB load + ESDB Ground = $4 \times 1293 + 248.5 = 5420.5 \text{ w}$

Phase voltage = 220 v

Pf = 0.8

EMDB load = $5420.5 \times 0.7 = 3794.35$

EMDB current = $3794.5 / (3 \times 220 \times 0.8) = 12.45 \text{ A}$

So, 15A TP MCCB is needed from EMDB to MDB.

A 5kw generator is used to supply the EMDB load.

4 x 4 rm NYY + 4rm BYA ECC is used.

Calculation for MDB

MDB load = (Total SDB + total EMDB + Pump Load) x 0.7

SDB load = 4 x SDB + SDB ground = $4 \times 6804.2 + 1622 = 28838.8 \text{ w}$

EMDB Load = 3794.35

Pump Load = 5000w

So, MDB load = (28838.8 + 3794.35 + 5000) x 0.7 = 26343.205 w

MDB current = $26343.205 / (3 \times 220 \times 0.8) = 86.41 \text{ A}$

100A TP MCCB is required from MDB to the main line.

4 x 70 mm NYY + 70 BYA ECC is used.

Calculations for Transformer

$S = 3VI = 3 \times 220 \times 86.41 = 57.0306 \text{ kVA}$

So, 11/0.415 KV, 50 HZ, 60 KVA, DYN 11, Oil Immersed Transformer with 4-6% Impedance is needed.

Calculation for minimum load density

According to Rajuk, for Air Conditioned Dwelling abodes 100 W/m² should be unit load.

In our Apartment load density is = (Total load)/apartment size in sq m
 $= (6804.2 + 1293) / (3808 \times 0.0929) = 22.875 \text{ W/m}^2$
